

Pro Camera Helmet

A safe camera helmet is

- Slightly squared in shape
- Nothing protruding from the side of the helmet
- Potential snagging points reduced to a minimum
- Light in weight and short in height
- Tightly fitted and secured with a chin guard
- No gap in between the inside liner and the hard shell
- Cutaway system installed and easily accessed

Tips

1. Inexpensive materials can be used to fill small gaps, materials like sticky foam and tape.

2. A bungee cord can be placed around the lens to secure it and prevent snagging.

3. Round sticker on the goggles is a great alternative to a ringsight.
